

Contract Supports National RECs Market

By Jeremy Weinstein and Roger Feldman

Prospects for a robust market in which renewable energy may be traded like any other commodity received a strong boost in February when an industry working group released version 1.0 of a standard form contract for national trading of renewable energy certificates (RECs), or "green tags." The document culminated a two-year effort by the working group, organized by two American Bar Association Committees, the Environmental Markets Association and the American Council On Renewable Energy.

The "Renewable Energy Certificate Purchase and Sale Agreement" is available online at www.acore.org/programs/retrading.php and www.environmentalmarkets.org. With the establishment of this agreement, parties may more easily enter into one or more transactions using the forms included in the contract.

Trading in RECs is an important market mechanism to optimize and promote renewable resource use and development. Approximately 23 states (and D.C.) have

renewable energy portfolio standards — most of which include solar energy — but no national program currently exists. In addition, RECs may be voluntarily traded (e.g., for purchase by an individual to offset the environmental impacts of energy used in travel), and at least two major nonprofit organizations independently certify RECs for this use.

The agreement can be used with RECs eligible for any of the programs and is designed to provide information as to exactly what attributes come with each REC. By working across multiple programs, the contract offers users the opportunity to reduce transaction costs, which enables participation by smaller-scale participants and increases opportunities for monetizing RECs from smaller-scale solar projects. A number of elections relating to payment terms — including their frequency and credit aspects — were written specifically with the small-size renewable resource in mind. For example, the contract user can elect for invoicing to be semiannual, which can help reduce

administrative costs for small resources.

A form in the contract for documenting specific transactions includes a table for generator-aggregation programs. Included and explained in the contract are two specific types of definitions for transactions tied to unit-contingent performance; these are particularly useful for intermittent resources such as solar.

The value of the contract will be better established as people become accustomed to using it to effect the buying and selling of RECs. As barriers between jurisdictions consequently erode, this document should help pave the way for a national marketplace in RECs that is accessible to large and small players alike, thus enhancing the value of solar-generated RECs.

Jeremy Weinstein (jweinstein@prodigy.net) of the Law Offices of Jeremy D. Weinstein in Walnut Creek, Calif., and Roger Feldman (rogerfeldman@andrewskurth.com) of Andrews Kurth LLP in Washington, D.C., were two of the working group's cochairs.

Three great innovations make PV's most versatile mounting system better than ever.

Save time on the roof. Meet NEC grounding standards without running a wire to every module. Clips align easily and stay in rail slots hands-free. Use familiar SolarMount top mounting clamps and easily create a grounding path through a single wire.

Less aluminum means lower cost — much lower. SolarMount Light is more than a third lighter than standard rail, yet its double hollow construction delivers all the strength to meet code in flush mount applications. Use the same top mounting clamps and footings that have always made SolarMount so easy to install.

Secure a rooftop array with ballast. UniRac's full-system approach makes it possible for arrays tilted up to 30 degrees. Our applications engineers will design a system based on your code requirements and site-specific wind loads.

These products are available now! Contact your PV distributor or UniRac for more information.

UNIRAC® THE STANDARD IN PV MOUNTING STRUCTURES™

U.S. and other patents pending.
